- Background
- Goal
- Benefits
- Solutions
- Design Considerations
- Short term solution
- Long term solution
- Challenges
- Handling Challenges
- Data Security Considerations
- Implementation & Cost
- Prevent Production Impact (Guardrails)
 - Read Only workload
 - ReadWrite workload
 - Avoid accidental replication to Primary
 - Avoid Confusion during DR scenario
- Improvement/Going forward/Automation

Background

Currently we do not have perf environment with prod like dataset. In our existing Perf environment we are unable to do performance testing for application because of size and data quality/distribution. This also includes performance testing explicitly for queries for initiatives having strict SLAs for response time and hence test overall workflow response.

Goal

To successfully perform application performance testing and query performance testing.

Benefits

Having prod like perf environment and data availability

- we would be able to do run performance tests (ReadWrite workload) from application without investing time in generating data first.
- Test performance of queries by explicitly run.
- We may also be able to replicate data specific issues that we may see in Production environment.

Solutions

	Solutions	Pros	Cons	Requirements	Cost Considerations	Risks /Reviews
1	Use US-EAST (DR site)	• No need for additional infra (IKS in us-east should be setup) • No customised sanitisation required • Data within PROD account • Easy to review w.r.t Security & Compliance	ReadOnly. No app running to test	• EC2 required to execute queries • IKS in us-east should be setup	NA	Accidentally writes to database
2	One time Clone DR database in US_EAST itself	• Can be used for RW workload • Data within PROD account • Easy to review w.r.t Security & Compliance	• limited sanitisation would be required (if app is running for testing) • No Batch jobs should be running • Could create confusion in DR switchover scenario	• IKS in us-east should be setup • EC2 required to execute queries	Refer below "Configuration" table	

3	Read Replica in US-EAST	- Read Only workload can be tested - Having latest data available	- Cannot do sanitisation because of having DB in read only mode - Cannot use for RW workload for same reason	EC2 required to execute queries	Refer below "Configuration" table	
4	Clone Prod database into Non-Prod account	RW, RO workloads can be tested	- Extensive data masking /sanitisation required - Improve Developer productivity - Accidentally writes to database is not a problem	- Changes to existing App config is required - Continuous refresh of Database from prod is required (every 6 - 12 months) - Establish CI/CD process similar to other env(SYS, PDS, QA)	Refer below "Configuration" table (Only for RDS, EC2)	Review w.r. t. Security /SOX compliance
5	Have separate Prod like AWS account and Copy data to that account for testing	- Data will be secure and compliant similar to actual PROD AWS account - RW workload	- Limited customised sanitisation required - No Batch jobs should be running - Maintain this account as well w.r.t security and compliance similar to actual PROD account	- EC2 required to execute queries - IKS should be setup - Continuous refresh of Database from prod is required (every 6 - 12 months)	TBD (Need to consider cost for all basic requirement to setup account + RDS+EC2+IKS etc.)	Review w.r. t. Security /SOX compliance

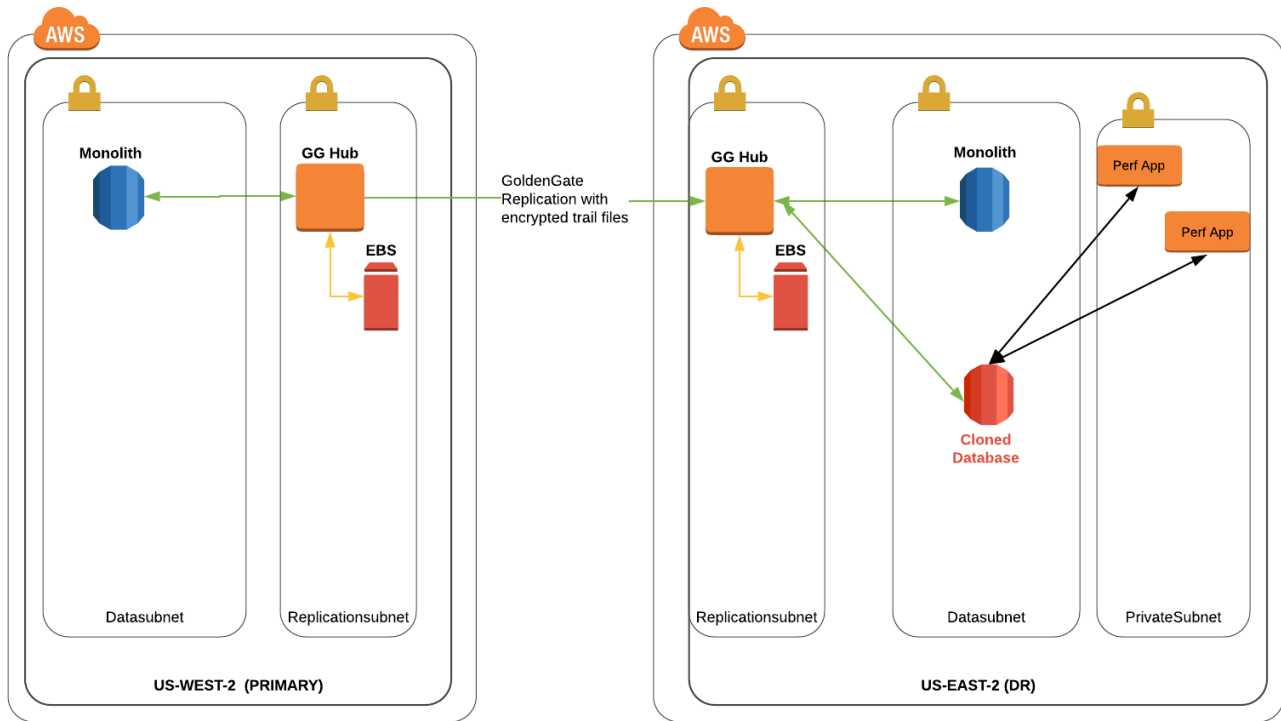

Design Considerations

- Freshness of data
- Support for writes to database (ReadWrite workload)
- Should be access via EC2 to test query performance
- Should have IKS setup to run application performance testing
- Improve developer productivity
- All batch jobs can be run.
- Always ready to run perf tests

Short term solution

- Having another database into DR region (same AWS prod account), which would be getting continuous replicated from primary/source database

Architecture Diagram

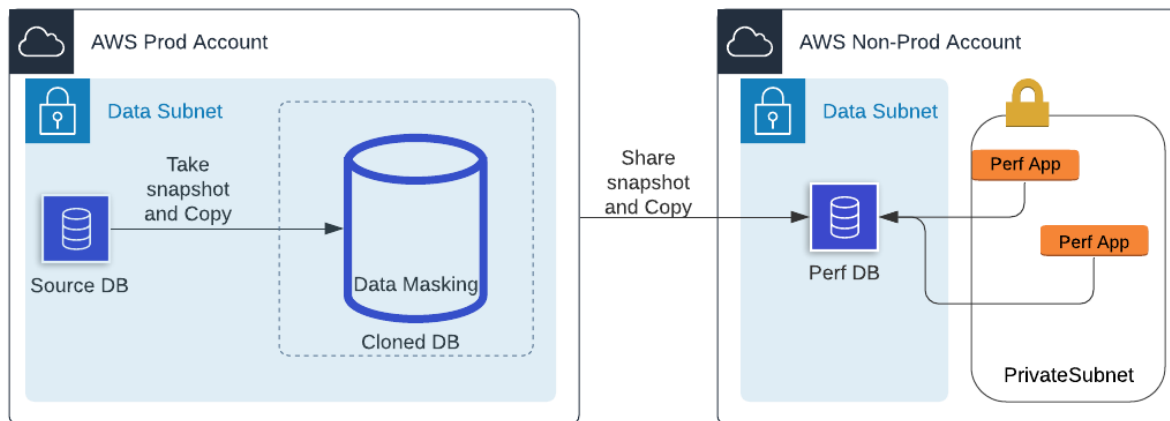

Compliance

- (GDPR) As on today, we mark customer data to be soft delete rather actually deleting data to ensure SOX compliance (keep 7 years old data). This would be working in same way as we will be replicating those tables to PERF database.

Long term solution

- Add details about which are all columns/fields(PII, Secret, Highly Sensitive, Sensitive) would be masked.
- Clone DR database into another database in same account. Mask/sanitize data in this cloned database.
- End-to-End process flow of getting that cloned database into non-prod account.

Challenges

With this solution, we would have require below efforts:

- How to use/handle Highly Sensitive, Sensitive, Restricted, PII data in perf database refreshed from Prod
- Extensive Data masking/Sanitisation
- Compliance review
- Security review
- Continuous refresh of 22 TB of data from prod to non-prod account every 6 - 12 months
- Ensure no external/downstream dependency issues

Handling Challenges

	Challenge	Owner	Comments
1	Compliance review (Sakshi) setup meeting with Jawadwala , Hussain & team , Iqbal, Anand MR, Karthi	Sakshi	Approaches Suggested • Separate database in DR site where we can connect to run perf tests : easy to be approved, since it is prod account, we are not moving data anywhere, and security guidelines are already there. • Put Data in a separate account with security guidelines similar to production, this will be called perf environment. Action Items • Check for plain text memo fields where PII data might be present - Sakshi • Detailed info on sanitisation - Sakshi • Document that in IHP also we were doing same thing - Sakshi/Mayank • Share wikis/notes of teams/DBAs who worked on similar requirement - David/Hussain Additional points to be taken care • User access review • Exception needs to be created • Exception will come with an end date, we will need to do review again after an year or so to check updated compliance guidelines
2	Security review setup meeting with Srivastava , Abhimanyu & team , Anand MR, Iqbal, Ketan, Karthi	Mayank	
3	POC on cross account database copy and restore	Mayank	
4	Extensive/Limited Data masking/Sanitization		

Data Security Considerations

- PSP prod data classification

	Data Classification	No Of Columns	Column Names
1	Secret	4	AUTHORIZATION_TOKEN PRIVATE_KEY PUBLIC_KEY P_I_N_VALUE

2	Highly Sensitive	26	RECORD_DATA AGENCY_ID F_E_I_N FILE_CONTENT ACCOUNT_NUMBER FED_TAX_ID AGENCY_TAXPAYER_ID DATE_OF_BIRTH SOCIAL_SECURITY_NUMBER E_I_N BIRTH_DATE TAX_ID MESSAGE MESSAGE_BKP OLD_EIN NEW_EIN COMPANY_EIN FRAUD_TRIGGER_DETAIL AGENCY_NAME FED_ID OLD_AGENCY_ID NEW_AGENCY_ID TXP_RECORD_DATA TAX_ID BIRTH_DATE S_S_N
---	------------------	----	---

- Copying Highly Sensitive, Sensitive, Restricted, Secret, PII data in perf database(non-prod account) from Prod (prod account)

Implementation & Cost

To be taken care

- Perf application setup in DR region (PROD account)
 - if app is running for testing, review any limited masking (if any) is still required ? This is to ensure no impact to customers/agents.
 - Batch jobs can be run ?
 - Any other workflows/modules need to be disabled (via flag) for perf tests run ?
 - Ensure how we can avoid confusion in DR switchover scenario when perf db (with application setup) is running
 - How to Handle IDPS keys ?
- GoldenGate Replication
 - GG replication will break after data gets overwritten by application during perf testing
 - Every 6/12 months, plan to rebuild this perf database and enable goldengate replication

Configuration	Config Value	Cost Estimation	Comments
RDS	Size: db.r5.12xlarge	~\$9600 (Monthly)	
	IOPS : 40k		
	Storage : 32 TB		
	Multi-AZ : No		

Application	IKS setup Perf test suite / Jmeter / Gatling Splunk/AppDynamic		Tools to capture resource utilisation, performance measurements(TP99. TP90 etc)
EC2	Size : m4.2xlarge Storage : 100 G Volume type for storage : GP2		To run queries manually for Dev team and capture performance.

Prevent Production Impact (Guardrails)

Read Only workload

- where does app resides-> private subnet
- dummy/qal endpoints
- load on IDPS while perf test
- whitelist CIDRs(whitelist only few modules)
- all high, monitor, normal pods to route to 504 maintenance page

ReadWrite workload

- how to prevent writing to active DB
- how to prevent running batchjobs

Avoid accidental replication to Primary

- Drop GGS (extract user) from cloned database
- No configuration for data extract
- With above, Goldengate process setup would be out of question without configuration for data extraction and pump for Perf database.

Avoid Confusion during DR scenario

- Different naming conventions for cloned/perf database
- No configuration for goldengate extract processes

Improvement/Going forward/Automation

- Regular Database refresh
- Data masking
