

DD Sync to PSP

- - understand the wiki - table understand the table. [DD Customer Data Migration to PSP- Impact Analysis](#)
- **PAYCHECK POC**
will go through video of money movement - praveen, ram , venky.
 - <https://drive.google.com/file/d/16cxvXIX4bmNGd57FgBPt48kQCh5KL3qZ/view?usp=sharing> - money movement [Ram]
 - Praveen
 - Venky
- create 2 company assisted and DIY+DD and we will how data is flowing in PSP code.

Functional Testing: [will give to regression]

- Compare the data in db with Assisted
- create custom payroll items and check the behaviour
- exception management scenarios - void, delete, update etc
- downgrade/upgrade company file

Impact Testing:[we will do] - we have only dd side changes

- check how data can flow in tables where we are not seeing data - go to results wiki and update missing table.
- backup and restore

how payroll items renumbering is working - sybase db and sap tools numbering [db table] verify numbering after sned to payroll [check with koustav]
backup before changes restore with changes [back without dd changes, and then open this backup in dd changes company and see the behaviour] - [check token behaviour]
backup with changes restore with changes.

-after sending payroll check response with respect to liability check and liability line items. - how we can send liability check and liability line items via ofx [[with assisted curent behaviour, dd current behaviour, and then dd changes behaviour](#)]

- check reject if missing flag in response - reject if missing verify in ofx response
- Migration of DD+VMP to Assisted [care help- RTB team help] - testing need to be done employee, payroll run ,
- check tokens for payroll items when syncing back. -
- check if data is being sent for vendors - [vendor is their in PSP] [asisted]
- check the tags in code which lead to creation of tax payment[mmt] and filing rows[w2] in db. - check psp side ind DD which flag stop creating this row.
- check in ATF[batch job] data extract that no info for the company should go - ATF[shivay or opraveen] DD company file shoule not upload in s3.[verify it]
- enable feature for new company file and enable for existing company -
- ** fixing renumbering on signOn (may/may not do) - sign on call renumbering will not work it is knows issue vmp+DD , if renumbering will happen then it will happen for all else no one, renumbering will happen for empid , payroll item id , paycheckid, transaction id.[can see in ofx for nexttempid, nextpayid etc tag]

paycheck 1\$ where it is getting deduccted and then should not affect changes -

DD Open items answered

es_employee_payitem
es_employee
es_paycheck_lineitem

perf - DD renumbering - cloud dd or assisted

Scenario :
Same ein and service key[DD+VMP] [existing thing]
comp1 -> emp1 -1 emp2 - 2 , payroll run

comp2 -> dd activate[PSID not assing] , no sync to psp emp3-1[sign call for activate dd will not do renumbering when add bank account detail on edit] ,

PSP side its is 3, run pay comp2 ,emp3 -1.

Same logic apply for paycheck on send to payroll.[db table i can check id]

Assited - it ask to sync then only create new emp for same ein and company

Refactore the code :

DD side testing -

Impact analysis :

- renumbering testing
- 2 comp scenario test with ein and service key
- All basic testing
- testing with

VMP on hone pai PSID create hoti thi which date will get added to ofx
same scenario he replicated and tried it to make run for DD

Challenges:

We have added all the tags which are present under assisted map to DD map. All the items we can populate in the OFX except Paycheck line items (salary line/ tax line..) since for DD company file we don't have payrollItemId (assisted_service_id) and the same is not associated with the Paycheck line items also. So, for DD currently if we want to add Paycheck line-item DT will restrict by throwing a crash. [file: cqbttoofx.c, line: 364].

Currently there is no mapping of payroll items in DT to PSP for DD company file. Hence pay items also are not getting populated in OFX as there is no service id attached and not marked to be sent for DD.

above means assisted_service_id not present in dd so solution is we created same flow existed for VMP for DD
