

Install eiamCli

Follow this to install eiamCLI on Mac/Linux/Windows, go through the ReadME on following link to download the latest release-

<https://github.intuit.com/EIAM/eiamCli-golang>

If you want install via brew then follow below steps:

- Check if you have homebrew installed or not

```
brew --version
```

If not installed then run below command

```
/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

Check version again

- Next ensure you have the secops_tools tap configured for Homebrew.

```
brew tap kubernetes/tools https://github.intuit.com/kubernetes/homebrew-tools.git
```

Follow steps in this link <https://github.intuit.com/EIAM/eiamCli-golang#for-mac-users> if you are getting an error "Non-file alias: /usr/local/Homebrew/Library/Taps/kubernetes/homebrew-tools/Aliases/kcm "

If you get a 403 from the 'brew tap' command above (see error below) due to password auth, run the tap command using the ssh url: 'brew tap kubernetes/tools [git@github.intuit.com:kubernetes/homebrew-tools.git](https://github.intuit.com:kubernetes/homebrew-tools.git)'.

Note that you must have your [ssh keys added in github](#) for this to work.

```
remote: Password authentication is not available for Git operations.
remote: You must use a personal access token or SSH key.
remote: See https://github.intuit.com/settings/tokens or https://github.intuit.com/settings/ssh
fatal: unable to access 'https://github.intuit.com/kubernetes/homebrew-tools.git/': The requested URL returned
error: 403
Error: Failure while executing; `git clone https://github.intuit.com/kubernetes/homebrew-tools.git /usr/local
/Homebrew/Library/Taps/kubernetes/homebrew-tools --origin=origin --template=` exited with 128.
```

- Run 'brew install eiamcli' (<https://github.intuit.com/EIAM/eiamCLI#installation>)

```
brew install eiamcli
```

Verify if its installed properly

```
eiamCli -v
```
