

PSP - DMS Loopback replication

- Context
- Goal
 - Oracle => Aurora Postgres Switchover (Friday, 08/26/2022)
 - Before application shutdown and user account lock on Oracle (A). Application is running on Oracle (A)
 - After user account lock on Oracle (A) and application shut down (all counters are 0)
 - After user account Unlock on Oracle (A) and starting application on Aurora Postgres (B)
 - Observations
 - Oracle => Aurora Postgres Switchover (Sunday, 08/28/2022)
 - Before application shutdown and user account lock on Aurora Postgres (B). Application is running on Aurora Postgres (B)
 - After user account lock on Aurora Postgres (B) and application shut down (all counters are 0)
 - After user account Unlock on Aurora Postgres (B) and starting application on Oracle (A)
 - Observations

Context

To show preventing loopback, suppose that in a task T1 AWS DMS reads change logs from source database A and applies the changes to target database B.

Next, a second task, T2, reads change logs from source database B and applies them back to target database A. Before T2 does this, DMS must make sure that the same changes made to target database B from source database A aren't made to source database A. In other words, DMS must make sure that these changes aren't echoed (looped) back to target database A. Otherwise, the data in database A can be corrupted.

Goal

To ensure loopback replication is working and there is no replication issue.

After user account Unlock on Oracle (A) and starting application on Aurora Postgres (B)

Observations

- We see that after application comes up on Aurora Postgres (B), replication statistics (DML) starts changing for B=>C & B=>A whereas replication statistics (DDL) are still 0 on replication from Oracle (A)=> Postgres (B). This is expected as application is not running on Oracle (A).
- DMS replications statistics during 2 days. There were 0 DML/DDl stats while replicating data from Oracle to Postgres.
- There are no DMS apply exceptions on target in DMS metadata.
- There are no table suspended as per DMS metadata on target
- All replication tasks are in running state

target metadata output

Observations

- We see that after application comes up on Oracle (A), replication statistics (DML) starts changing for A=>B & B=>C whereas replication statistics (DML) are still 0 on replication from Aurora Postgres (B) => Oracle (A). **This is expected as application is not running on Aurora Postgres (B).**
- There are no DMS apply exceptions on target in DMS metadata.
- There are no table suspended as per DMS metadata on target
- All replication tasks are in running state

target metadata ouput
