

Setup Oracle GoldenGate Veridata 12c

- Overview
 - 1. Preparation for Veridata Console
 - 1.1. Create Goldengate Hub as Veridata server
 - 1.2. Create a RDS as Veridata repository db
 - 1.3. Setup the environment
 - 1.4. Copy scripts and software
 - 2. Installation
 - 2.1 Setup JDK
 - 2.2 Setup Weblogic Server
 - 2.3 Setup Oracle GoldenGate Veridata
 - 2.4 Create Repository
 - 2.5 Configure Domain for Oracle GoldenGate Veridata
 - 2.5a Setup up WebLogic ELB
 - 2.5c Create Veridata user data
 - 2.6a Manual Settings
 - 2.6b Setup up Veridata ELB
 - 2.8 Setup Veridata profile sort_profile_new
 - 2.9 Setup https on WebLogic and Veridata
 - 3. Prepare for Veridata Agents Host in AWS
 - 4. Common Issues

Overview

1. IMPORTANT : Most of the scripts have hardcoded dbname, hostname , username and password.

a) 5 myDomain-ds.properties. files*

>>Change these lines based on the VIP, DB Name and VD prefix:

b) passwordfile.txt (1st line is for sys password)

c) create_domain_7001.py

>>Change these lines based on the domain path, hostname , weblogic user password , weblogic port

```
readTemplate('/u01/veridata/oradata/verirep/wls/wlserver/common/templates/wls/wls.jar') cmo.setPassword('welcome123') cmo.setListenPort(7001) cmo.setListenAddress('ggpsppf501.ie.intuit.net') writeDomain('/u01/veridata/oradata/verirep/wls/user_projects/domains/base_domain')
```

1. Preparation for Veridata Console

1.1. Create Goldengate Hub as Veridata server

```
./create_gg_hub_ha_PSP_PROD_UW2_Linux7_IDPS.sh psp prod pspvd1pt us-west-2 vpc-2 yes  
Change InstanceTypes for prod to m4.2xlarge in goldengate-hub-ha.json file as below:
```

```
"InstanceTypes": {  
  "GoldenGate": {  
    "qa": "m4.large",  
    "e2e": "m4.large",  
    "prf": "m4.large",  
    "stg": "m4.large",  
    "sbx": "m4.large",  
    "prod": "m4.xlarge"  
  }  
},  
to  
"InstanceTypes": {  
  "GoldenGate": {  
    "qa": "m4.large",  
    "e2e": "m4.large",  
    "prf": "m4.large",  
    "stg": "m4.large",  
    "sbx": "m4.large",  
    "prod": "m4.4xlarge"  
  }  
},
```

1.2. Create a RDS as Veridata repository db

`./create_rds.sh e2e epsvdpdt us-west-2 vpc-3`

Create the below Tablespaces for Veridata:

```
CREATE TABLESPACE VERIDATA DATAFILE SIZE 5G AUTOEXTEND ON NEXT 1G MAXSIZE UNLIMITED;  
CREATE TEMPORARY TABLESPACE VERIDATA_TEMP TEMPFILE SIZE 1G AUTOEXTEND ON NEXT 1G MAXSIZE UNLIMITED;
```

1.3. Setup the environment

#1. Ensure we have an Oracle DB setup for Veridata

#2. Required Dir path exists as per the need

```
mkdir -p /u01/veridata/wls  
mkdir -p /u01/veridata/Inv  
mkdir -p /u01/veridata/jdk1.8  
mkdir /tmp/setup_veridata_srv
```

1.4. Copy scripts and software

#1. Copy the below listed tar and sql files from S3 to Golden Gate Hub (Veridata Console) /tmp directory. You can also copy the files from git repo: https://github.com/qbo/qbo-ops-script-refreshed/tree/master/newdb/setup_veridata_srv

```
setup_veridata_srv.tar
veridata_tables.sql
veridata_procedures.sql
```

For e.g:

```
e2e: aws s3 cp s3://bits-sbg-qbo-ppd-us-west-2/binaries/goldengate/temp/Veridata/setup_veridata_srv.tar /tmp
/setup_veridata_srv/setup_veridata_srv.tar
\\
```

Prod:

```
mkdir /tmp/setup_veridata_srv
cd /tmp/setup_veridata_srv
aws s3 cp s3://bits-sbg-qbo-prod-us-west-2/binaries/goldengate/Veridata/setup_veridata_srv.tar .
\\
cd /u01/ogg/scripts
aws s3 cp s3://bits-sbg-qbo-prod-us-west-2/binaries/goldengate/Veridata/veridata_srv_scripts.tar .
\\
```

#2. Untar the files on the new Veridata Console server.

```
cd /tmp/setup_veridata_srv
tar -xvf setup_veridata_srv.tar
```

#3. On the new Veridata server, you should have the following files in the temp dir-

```
[oracle@ggppsppf501 setup_veridata_srv]$ ls -ltr
total 4728360
-r-xr-xr-x. 1 oracle oinstall 1563217124 Oct  9  2016 fmw_12.2.1.2.0_infrastructure.jar
-rw-r--r--. 1 oracle oinstall      8986 Oct 11  2016 fmw_12212_readme.htm
-r-xr-xr-x. 1 oracle oinstall  446021430 Oct 11  2016 fmw_12.2.1.2.0_ogg.jar
-rw-----. 1 oracle oinstall  445820174 May 27 12:57 fmw_12.2.1.2.0_ogg_Disk1_1of1.zip
-rw-----. 1 oracle oinstall 1563100157 May 27 12:57 FWM_122120_infra_V779122-01.zip
-rw-----. 1 oracle oinstall  445820174 May 27 12:57 V789398-01.zip
-rw-----. 1 oracle oinstall    410 May 27 13:07 create_domain_7001.py
-rw-----. 1 oracle oinstall    337 May 27 13:07 enable_domain_7001.py
-rw-----. 1 oracle oinstall    342 May 27 13:07 enable_domain_7001_1.py
-rw-----. 1 oracle oinstall    338 May 27 13:07 enable_domain_7001_2.py
-rw-----. 1 oracle oinstall  377784320 May 27 13:07 jdk-1.8-u131-x64.tar
-rw-----. 1 oracle oinstall    428 May 27 13:07 myDomain-ds.properties.opsaudDBDS

-rw-----. 1 oracle oinstall    75 May 27 13:07 passwordfile.txt
-rw-----. 1 oracle oinstall   3013 May 27 13:16 create_data_source.py
-rwx-----. 1 oracle oinstall    599 May 28 11:31 veridata_srv_resp
-rwx-----. 1 oracle oinstall   1310 May 28 11:36 fusion_middleware_resp
```

#4. Correct Golden Gate Hub host name and RDS Repository instance connect string

```
create_domain_7001.py
myDomain-*
myDomain-*
```

#5. Make sure the below 2 lines are commented out in create_data_source.py:

```
\\
cd('/SystemResources/' + dsName)
set('Targets',jarray.array(\[ObjectName('com.bea:Name=' + dsTargetName + ',Type=' + dsTargetType)\],
ObjectName))
```

#6. Update the '<password>' & <wl-password> in all myDomain-* files (weblogic and Veridata users)

```
admin.password=<wl-password>
ds.password=<password>
```

2. Installation

2.1 Setup JDK

```
cd /tmp/setup_veridata_srv
unzip FWM_122120_infra_V779122-01.zip
unzip fmw_12.2.1.2.0_ogg_Disk1_1of1.zip
cp jdk-1.8-u131-x64.tar.gz /u01/veridata/jdk1.8/
/u01/veridata/jdk1.8/
tar -xvf /tmp/setup_veridata_srv/jdk-1.8-u131-x64.tar

update /l/<SID> file to add JAVA_HOME environment variable and add it to PATH and LD_LIBRARY_PATH variable

export JAVA_HOME=/u01/veridata/jdk1.8/jdk1.8.0_131
export PATH=${JAVA_HOME}/bin:${ORACLE_HOME}/bin:${ORACLE_HOME}:${PATH}:/l:/usr/sbin

export
LD_LIBRARY_PATH=${JAVA_HOME}/jre/lib/amd64/server:${ORACLE_HOME}/lib32:${ORACLE_HOME}/lib:${ORACLE_HOME}/jdbc
/lib:/usr/openwin/lib:/usr/dt/lib

Source DB profile file
. /l/<SID> or . /l/orcl (aws)
```

2.2 Setup Weblogic Server

```

export temp_dir=/tmp/setup_veridata_srv
export MW_HOME=/u01/veridata/wls
export WLS_HOME=$MW_HOME/wlserver
cd $temp_dir
#export _JAVA_OPTIONS="-Djava.io.tmpdir=$temp_dir"

java -jar fmw_12.2.1.2.0_infrastructure.jar -silent -responseFile $temp_dir/fusion_middleware_resp -invPtrLoc
$temp_dir/oraInst.loc

##### Output should be like below on completion #####

[oracle@ggppsppf501 setup_veridata_srv]$ java -jar fmw_12.2.1.2.0_infrastructure.jar -silent -responseFile
$temp_dir/fusion_middleware_resp -invPtrLoc $temp_dir/oraInst.loc
Launcher log file is /tmp/OraInstall2020-05-28_11-39-03AM/launcher2020-05-28_11-39-03AM.log.

Logs successfully copied to /u01/veridata/oraInventory/logs.
#####

MANUAL WORK
Add the last third line in the listed sql file below the mentioned ALTER SESSION stmt

vi $MW_HOME/oracle_common/common/sql/opss/scripts/opss_tables.sql
ALTER SESSION SET CURRENT_SCHEMA=&&1 ;
alter session set NLS_LENGTH_SEMANTICS=BYTE;

```

2.4 Create Repository

NOTE: 1. "-schemaPrefix " will add the specified prefix to the db usernames that will be added as part of installation. For example by giving VD1, we will have VD1_VERIDATA user in the db.

2. \$temp_dir/passwordfile.txt file has 7 passwords: first is sys db user password; second is for weblogic user password; next 5 passwords are for the new users being created at this step. Please make sure that sys and weblogic users' passwords are correct.

3. If any of these below steps fails, rename wls directory under /u01/veridata/ and restart from step #2.2

```
cd $MW_HOME/oracle_common/bin
```

```
./rcu -silent -createRepository -databaseType ORACLE -connectString pspfib1.sbg-ppp-ppd.a.intuit.com:1521:
psppfib1 -dbUser intuadmin -schemaPrefix VD \
-component IAU -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
-component IAU_APPEND -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
-component IAU_VIEWER -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
-component OPSS -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
-component VERIDATA -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
-component STB -tablespace VERIDATA -tempTablespace VERIDATA_TEMP -f < $temp_dir/passwordfile.txt
```

Output should be like below on completion

```
[oracle@ggppsppf501 bin]$ ./rcu -silent -createRepository -databaseType ORACLE -connectString pspfib1.sbg-ppp-
ppd.a.intuit.com:1521:psppfib1 -dbUser intuadmin -schemaPrefix VD \
> -component IAU -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
> -component IAU_APPEND -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
> -component IAU_VIEWER -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
> -component OPSS -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
> -component VERIDATA -tablespace VERIDATA -tempTablespace VERIDATA_TEMP \
> -component STB -tablespace VERIDATA -tempTablespace VERIDATA_TEMP -f < $temp_dir/passwordfile.txt
Picked up _JAVA_OPTIONS: -Djava.io.tmpdir=/tmp/setup_veridata_srv
```

```

2.5a Setup up WebLogic ELB

- (one time only per environment) Download the script `create_veridata_security_group.sh` from the end of this Wiki
- (one time only per environment) Run the following command to create the security group for ELB
- Modify the veridata ELB security group by adding `<your IP>/32` on http (port 80) temporarily. You can get your IP by running "`curl {+}https://api.ipify.org+`" from your machine. You should delete this entry after complete the Veridata configuration.
- (one time only per environment) Add ports 7001 and 8830 with the source of the security group created above to the security group `prod-goldengate-vpc-3`
- Login to the AWS console and choose `us-west-2` (Oregon)
- Go to `EC2=>Load Balances`
- Click `Create Load Balance`
- Click `Create` under `Classic Load Balance`
- Enter "`prod-veridata-weblogic`" as Load Balancer name
- Select `Intuit-vpc-3` as Create LB Inside
- Enter 7001 as Instance Port
- Choose `IngressSubnetAz1` and `IngressSubnetAz2` subnets
- Unselect default security group and select `prod-veridata-vpc-3` security group
- Enter "`/console/login/LoginForm.jsp`" as Ping Path
- Choose Veridata server EC2 instance `goldengate-qbpvd1pt-xxx`
- Add Name as Key and "`prod-veridata-weblogic`" as value on Add Tags section
- Click `Review and Create`
- Click `Create`
- After Weblogic is started, go to `Ec2=>Load Balances` and search newly created load balance
- Click `Instances` to make sure that the status is "`inService`". Otherwise, you need to check whether Weblogic is started successfully
- Click `Description`, copy the DNS Name's value and then past `<dns name>/consolelogin/LoginForm.jsp` to browser. You will login to Weblogic.

2.5b Verify Data Sources

- Login to WebLogic Server and goto `base_domain->Services->Data Sources`. You should see the below 5 datasources
- WebLogic Server URL: `{+}http://e2e-goldengate-veridata-weblogic-836817812.us-west-2.elb.amazonaws.com/console+`

ORACLE WebLogic Server Administration Console 12c

Summary of JDBC Data Sources

Configuration Monitoring

A JDBC data source is an object bound to the JNDI tree that provides database connectivity through a pool of JDBC connections. Applications can look up a data source on the JNDI tree and then borrow a database connection from a data source.

This page summarizes the JDBC data source objects that have been created in this domain.

[Customize this table](#)

Data Sources (Filtered - More Columns Exist)

Name	Type	JNDI Name	Targets

password=welcome123

cd $MW_HOME/user_projects/domains/base_domain/veridata/bin
nohup ./veridataServer.sh start >/dev/null 2>&1 &
```

2.6b Setup up Veridata ELB

- Login to the AWS console and choose us-west-2 (Oregon)
- Go to EC2=>Load Balances
- Click Create Load Balance
- Click Create under Classic Load Balance
- Enter "prod-veridata" as Load Balancer name
- Select Intuit-vpc-3 as Create LB Inside
- Enter 8830 as Instance Port
- Choose IngressSubnetAz1 and IngressSubnetAz2 subnets
- Unselect default security group and select prod-veridata-vpc-3 security group
- Enter "/veridata/login.jsf" as Ping Path
- Choose Veridata server EC2 instance goldengate-qbpvd1pt-xxx
- Add Name as Key and "prod-veridata" as value on Add Tags section
- Click Review and Create

- Click Create
- After Veridata is started, go to Ec2=>Load Balances and search newly created load balance
- Click Instances to make sure that the status is "inService". Otherwise, you need to check whether Veridata is started successfully
- Click Description, copy the DNS Name's value and then past <dns name>/veridata/login.jsf to browser. You will login to Veridata

2.8 Setup Veridata profile sort_profile_new

In Veridata UI > Profile Configuration -> New

New Profile Assistant

Task 1: Profile Name

Please specify profile name and description

☐ Create new profile using copy of existing profile.

2.9 Setup https on WebLogic and Veridata

Generate certificates for Load Balancer and Veridata server (ggpsppf501.sbg-psp-ppd.a.intuit.com for the following instruction)

The certificate for Load Balancer should include the domain name goldengate.sbg-psp-ppd.a.intuit.com, goldengate.sbg-psp-prod.a.intuit.com, goldengate-weblogic.sbg-psp-ppd.a.intuit.com, goldengate-weblogic.sbg-psp-prod.a.intuit.com. The file should include the following sections

```

-----BEGIN CERTIFICATE-----
...
-----END CERTIFICATE-----
-----BEGIN RSA PRIVATE KEY-----
...
-----END RSA PRIVATE KEY-----
Key Chain:
-----BEGIN CERTIFICATE-----
...
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
...
-----END CERTIFICATE-----

```

The certificate for Veridata server should include the following four files

```

ggpsppf501.sbg-psp-ppd.a.intuit.com.crt
ggpsppf501.sbg-psp-ppd.a.intuit.com.key
root.pem
intermediate.pem

```

- Login the Veridata server (ggpsppf501.sbg-psp-ppd.a.intuit.com) and sudo su - oracle.
- Perform the following steps to setup a keystore

Note: Need to replace <password> with the real password you choose

```

oracle@ggpsppf501 ~$ cd /u01/veridata/wls/user_projects/domains/base_domain/bin
oracle@ggpsppf501 bin$ . ./setDomainEnv.sh
oracle@ggpsppf501 base_domain$ cd /u01/veridata/wls/
oracle@ggpsppf501 wls$ mkdir keystores

```

Copy the certificate files to /u01/veridata/wls/keystores

```

oracle@ggpsppf501 keystores$ ls -ltr
total 16
-rw-r--r-- 1 oracle oinstall 2569 May 31 11:39 ggpsppf501.sbg-psp-ppd.a.intuit.com.crt
-rw-r--r-- 1 oracle oinstall 1492 May 31 11:40 root.pem
-rw-r--r-- 1 oracle oinstall 1787 May 31 11:43 intermediate.pem
-rw-r--r-- 1 oracle oinstall 1678 May 31 11:44 ggpsppf501.sbg-psp-ppd.a.intuit.com.key

```

```

oracle@ggpsppf501 keystores$ openssl pkcs12 -export -in ggpsppf501.sbg-psp-ppd.a.intuit.com.crt -inkey ggpsppf501.sbg-psp-ppd.a.intuit.com.key -out
server.p12 -name ggpsppf501.sbg-psp-ppd.a.intuit.com -CAfile root.pem -caname "Digicert CA Root"
Enter Export Password:
Verifying - Enter Export Password:

```

```

oracle@ggpsppf501 keystores$ keytool -importkeystore -deststorepass Intuit#m3 -destkeystore keystore.jks -srckeystore server.p12 -srcstoretype
PKCS12 -srcstorepass Intuit#m3
Entry for alias ggpsppf501.sbg-psp-ppd.a.intuit.com successfully imported.
Import command completed: 1 entries successfully imported, 0 entries failed or cancelled

```

```

oracle@ggpsppf501 keystores$ keytool -import -trustcacerts -alias intermediate -file intermediate.pem -keystore keystore.jks -storepass Intuit#m3
Certificate was added to keystore

```

```

oracle@ggpsppf501 keystores$ keytool -list -v -keystore keystore.jks -storepass Intuit#m3 > out.txt

```

```

oracle@ggpsppf501 keystores$ cat out.txt | egrep "Your keystore contains|Alias"
Your keystore contains 2 entries
Alias name: ggpsppf501.sbg-psp-ppd.a.intuit.com
Alias name: intermediate

```

```

oracle@ggpsppf501 keystores$ ls -l /u01/veridata/wls/keystores/keystore.jks
-rw-r--r-- 1 oracle oinstall 4317 May 31 13:17 /u01/veridata/wls/keystores/keystore.jks

```

- Add security group prod-veridata-vpc-3 as source with ports 7002 and 8831 to the security group prod-goldengate-vpc-3 through AWS console

- Configure WebLogic AdminServer to use keystone
 - You may check Configuring Oracle WebLogic Server (10.3.x - 12.1.x) to use SSL in Fusion Middleware 11g/12c (Doc ID 1235653.1) about the following steps
 - Login WebLogic Administration Console (<http://<dns name>/console/login/LoginForm.jsp>)
 - Select 'Environment' -> 'Servers' and click on AdminServer(admin)
 - Select the 'Keystores' tab
 - Select 'Keystore -> 'Change'
 - Select 'Custom Identity and Custom Trust' from the drop down list and click 'Save'
 - Enter the relevant information in the Keystores page:
 - 'Custom Identity Keystore' : /u01/veridata/wls/keystores/keystore.jks
 - 'Custom Identity Keystore Type' : JKS (Note: This has to be UPPERCASE)
 - 'Custom Identity Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - 'Confirm Custom Identity Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - 'Custom Trust Keystore' : /u01/veridata/wls/keystores/keystore.jks
 - 'Custom Trust Keystore Type' : JKS (Note: This has to be UPPERCASE)
 - 'Custom Trust Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - 'Confirm Custom Trust Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - Click 'Save'
 - Select the 'SSL' tab and enter the relevant information:
 - 'Private Key Alias' : ggpsppf501.sbg-ppsp-ppd.a.intuit.com (Veridata server name)
 - 'Private Key Password' : <keypass_pwd> e.g welcome
 - 'Confirm Private Key Password' : <keypass_pwd> e.g welcome
 - Click 'Save'
 - Select 'Environment' -> 'Servers' and click on the Managed Server configured
 - In the 'General' tab:
 - Check 'SSL Listen Port Enabled'
 - 'SSL Listen Port' : 7002
 - Click 'Save'

- Login to the Veridata server and then restart WebLogic

```
oracle@ggpsppf501 bin$ cd /u01/veridata/wls/user_projects/domains/base_domain/bin
oracle@ggpsppf501 bin$ . ./setDomainEnv.sh
oracle@ggpsppf501 base_domain$ cd /u01/veridata/wls/user_projects/domains/base_domain/bin
oracle@ggpsppf501 bin$ ./stopWebLogic.sh
oracle@ggpsppf501 bin$ nohup ./startWebLogic.sh > startWebLogic.log 2>&1 &
```

- Test https on Veridata server

```
oracle@ggpsppf501 ~$ curl https://ggpsppf501.sbg-ppsp-ppd.a.intuit.com:7002/console
<html><head><title>302 Moved Temporarily</title></head>
<body bgcolor="#FFFFFF">
<p>This document you requested has moved
temporarily.</p>
<p>It's now at <a href="https://ggpsppf501.sbg-ppsp-ppd.a.intuit.com:7002/console/">https://ggpsppf501.sbg-ppsp-ppd.a.intuit.com:7002/console/</a>.</p>
</body></html>
```

- Import the Load Balancer certificate using AWS Console
 - Go to Certificate Manager
 - Select Import Certificate
 - Click "Review and import". You should see the screen like below.
 - Click Import
- Change WebLogic Load Balancer prod-veridata-webloic configuration
 - Edit Listeners:
 - Load Balancer Protocol: from HTTP to HTTPS
 - Load Balancer Port: from 80 to 443
 - Instance Protocol: from HTTP to HTTPS
 - Instance Port: from 7001 to 7002
 - SSL Certificate: <select imported certificate>
- Edit Health Check:
 - Ping Protocol: from HTTP to HTTPS
 - Ping Port: from 7001 to 7002
- Create a Route53 record set through AWS Console

- Name: goldengate-weblogic.sbg-qbo-prod.a.intuit.com
 - Type: CNAME
 - Value: prod-veridata-weblogic-498543478.us-west-2.elb.amazonaws.com (this is the Load Balancer prod-veridata's DNS)
- <https://goldengate-weblogic.sbg-psp-ppd.a.intuit.com/console> is WebLogic URL. Try it on browser
- Configure WebLogic Veridata to use keystone
 - You may check Configuring Oracle WebLogic Server (10.3.x - 12.1.x) to use SSL in Fusion Middleware 11g/12c (Doc ID 1235653.1) about the following steps
 - Login WebLogic Administration Console (<https://<dns name>/console/login/LoginForm.jsp>)
 - Select 'Environment' -> 'Servers' and click on VERIDATA_server1
 - Select the 'Keystores' tab
 - Select 'Keystore -> 'Change'
 - Select 'Custom Identity and Custom Trust' from the drop down list and click 'Save'
 - Enter the relevant information in the Keystores page:
 - 'Custom Identity Keystore' : /u01/veridata/wls/keystores/keystore.jks
 - 'Custom Identity Keystore Type' : JKS (Note: This has to be UPPERCASE)
 - 'Custom Identity Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - 'Confirm Custom Identity Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - 'Custom Trust Keystore' : /u01/veridata/wls/keystores/keystore.jks
 - 'Custom Trust Keystore Type' : JKS (Note: This has to be UPPERCASE)
 - 'Custom Trust Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - 'Confirm Custom Trust Keystore Passphrase' : <storepass_pwd> e.g: welcome
 - Click 'Save'
 - Select the 'SSL' tab and enter the relevant information:
 - 'Private Key Alias' : ggqbpvd1pt.sbg-qbo-prod.a.intuit.com (Veridata server name)
 - 'Private Key Password' : <keypass_pwd> e.g welcome
 - 'Confirm Private Key Password' : <keypass_pwd> e.g welcome
 - Click 'Save'
 - Select 'Environment' -> 'Servers' and click on the Managed Server configured
 - In the 'General' tab:
 - Check 'SSL Listen Port Enabled'
 - 'SSL Listen Port' : 8831
 - Click 'Save'
- Login to the Veridata server and then restart WebLogic

```
oracle@ggpsppf501 bin$ cd /u01/veridata/wls/user_projects/domains/base_domain/veridata/bin
oracle@ggpsppf501 bin$ ./veridataServer.sh stop
oracle@ggpsppf501 bin$ nohup ./veridataServer.sh start >/dev/null 2>&1 &
```

- Test https on Veridata server

```
oracle@ggpsppf501 ~$ curl https://ggpsppf501.sbg-psp-ppd.a.intuit.com:8831/veridata/login.jsf
```

- Change WebLogic Load Balancer prod-veridata configuration
 - Edit Listeners:
 - Load Balancer Protocol: from HTTP to HTTPS
 - Load Balancer Port: from 80 to 443
 - Instance Protocol: from HTTP to HTTPS
 - Instance Port: from 8830 to 8831
 - SSL Certificate: <select imported certificate>
 - Edit Health Check:
 - Ping Protocol: from HTTP to HTTPS
 - Ping Port: from 8830 to 8831
- Create a Route53 record set through AWS Console
 - Name: goldengate.sbg-qbo-prod.a.intuit.com
 - Type: CNAME
 - Value: prod-veridata-2009728932.us-west-2.elb.amazonaws.com (this is the Load Balancer prod-veridata's DNS)
- <https://goldengate.sbg-psp-ppd.a.intuit.com/veridata/login.jsf> is Veridata URL. Try it on browser

3. Prepare for Veridata Agents Host in AWS

Follow steps in <https://wiki.intuit.com/display/EMSPD/Setup+veridata+agent>

4. Common Issues

1. Error on executing `java weblogic.WLST $temp_dir/create_data_source.py -p $temp_dir/myDomain-ds.properties`.

```
Starting an edit session ...
Started edit session, please be sure to save and activate your
changes once you are done.
This Exception occurred at Wed May 09 10:45:25 PDT 2018.
javax.management.InvalidAttributeValueException: Array has at least one null element
Problem invoking WLST - Traceback (innermost last):
  File "/tmp/setup_veridata_srv/create_data_source.py", line 92, in ?
    File "<iostream>", line 563, in set
    File "<iostream>", line 552, in raiseWLSTException
WLSTException: Error occurred while performing set : Error setting attribute Targets : Array has at least one
null element
Use dumpStack() to view the full stacktrace :
```

Workaround - In `create_data_source.py`, comment out the below two lines-

```
cd('/SystemResources/' + dsName)
set('Targets',jarray.array(\[ObjectName('com.bea:Name=' + dsTargetName + ',Type=' + dsTargetType)\],
ObjectName))
```

2. If the Target field is empty for all Data Sources in weblogic (Step 2.5a Verify Data Source), try adding the target (i.e, AdminServer, VERIDATA_Server_1) manually.
If veridata fails to start then stop the weblogic server, rename the \$MW_HOME (wls to wls.bak) and repeat the steps from 2.2.

3. There could be issue while running command "`java weblogic.WLST $temp_dir/create_data_source.py -p $temp_dir/myDomain-ds.properties.opss`"
Solution : Set CLASSPATH env variable as below
`export CLASSPATH=$CLASSPATH:$JAVA_HOME/lib/tools.jar:$MW_HOME/wlserver/modules/features/wlst.wls.classpath.jar`

4. There could be issue where admin server listening to 127.0.0.1. Change /etc/hosts as below:

```
[oracle@ggpspiob1 scripts]$ cat /etc/hosts
# Your system has configured 'manage_etc_hosts' as True.
# As a result, if you wish for changes to this file to persist
# then you will need to either
# a.) make changes to the master file in /etc/cloud/templates/hosts.redhat.tmpl
# b.) change or remove the value of 'manage_etc_hosts' in
#    /etc/cloud/cloud.cfg or cloud-config from user-data
#
# The following lines are desirable for IPv4 capable hosts
#127.0.0.1 ggpspiob1.sbg-ppd.a.intuit.com ggpspiob1
127.0.0.1 localhost.localdomain localhost
127.0.0.1 localhost4.localdomain4 localhost4

# The following lines are desirable for IPv6 capable hosts
#::1 ggpspiob1.sbg-ppd.a.intuit.com ggpspiob1
::1 localhost.localdomain localhost
::1 localhost6.localdomain6 localhost6
```
